To whom it may concern

RE:**Master Thomas Thirlwall****DOB: 14/03/2011**

I have attached the relevant recent results of any pathology and imaging investigations for you records.

Yours Sincerely,
Dr Nitin Gupta

Tests Completed: C DIFF PCR

D-CDTF (C DIFF PCR)

Clinical Notes : NO HISTORY

Clostridium difficile toxin PCR

Specimen	Faeces
C. difficile tcdB gene	Not Detected
Comment on Lab ID 279721162	

The tcdB gene of Clostridium difficile is the primary virulence factor for C. difficile infection (CDI) and this test is appropriate for use only on unformed stool from patients with clinically significant diarrhoea.

Supervising Pathologist: IC

Vitamin D	52	55	nmol/L	(50-140)

Comments on Collection 07/08/18 0836 F:

Consistent with Vitamin D adequacy.

According to the Position Statement 'Vitamin D and health in adults in Australia and New Zealand' MJA, 196(11):686-687, 2012, Vitamin D status is defined as:

Mild Deficiency	30	-	49 nmol/L
Moderate Deficiency	12.5	-	29 nmol/L
Severe Deficiency	<12.5		nmol/L

Vitamin D adequacy can be defined as a level >49 nmol/L at the end of winter - the level may need to be 10 - 20 nmol/L higher at the end of summer, to allow for seasonal decrease..

From 1st November 2014, Medicare rebates for vitamin D testing will apply to patients at risk of Vitamin D deficiency such as chronic lack of sun exposure.

Coeliac Serology

Deamidated Gliadin IgA	<1	U/mL	(	<15	)
Deamidated Gliadin IgG	7	U/mL	(	<15	)
Tissue Transglutaminase IgA	2	U/mL	(	<15	)
Tissue Transglutaminase IgG	<1	U/mL	(	<15	)

Comment on Lab ID 278375501

From 03/06/2013, all requests for coeliac serology will be analysed by a multiplex assay which simultaneously detects deamidated gliadin IgA and IgG as well as tissue transglutaminase IgA and IgG antibodies. All four results are reported regardless of request and if selective IgA deficiency is detected (<0.07 g/L) which would render IgA-based serology non-informative this is also reported.

In a person eating wheat, the presence of one positive antibody may occur without coeliac disease while multiple positive antibodies strongly predict coeliac disease which should be confirmed by biopsy. For monitoring coeliac disease, IgA antibodies may become negative after 6-9 months of gluten restriction while IgG antibodies may take 9-12 months; persistent positive serology suggests non-compliance. Risk of coeliac disease may be effectively excluded if HLA-DQ2 or HLA-DQ8 are not detected in persons with discordant serology or positive family history. Endomysial IgA antibodies can be performed on request but we believe they have limited clinical utility with our new deamidated gliadin and TTG assays.

Clinical Notes : NO HISTORY

Faecal Calprotectin

Faecal Calprotectin 16 mg/kg (<50)
Comment on Lab ID 279721162

Elevated faecal calprotectin indicates a high probability of intestinal inflammation. Levels of faecal calprotectin above 250 mg/kg have greater positive predictive value especially in children. For patients with known inflammatory bowel disease in remission, faecal calprotectin above 50 mg/kg is associated with an increased risk of relapse over the next 12 months. In patients with faecal calprotectin levels below 50 mg/kg with strong clinical indications of intestinal inflammation, a repeat sample may be useful. In small bowel Crohn's the faecal calprotectin may be within the normal range. Many conditions including bowel cancer, NSAID ulceration, coeliac disease, diverticulitis and chronic inflammation may cause elevated faecal calprotectin. This test has not been validated in children under two years of age.
Reported by Sullivan and Nicolaides Pathology, a member of the Sonic Healthcare Group.

Endomysial IgA Abs Not Detected
Comment on Lab ID 278375501

EMA antibodies not detected. Tissue transglutaminase (tTG) and deamidated gliaden IgA /IgG antibodies are a more sensitive and specific screening test for coeliac disease/dermatitis herpetiformis.
