CYTOMEGALOVIRUS SEROLOGY

CMV IgG Antibodies : Not Detected

CMV IgM Antibodies : Not Detected

CMV Comment:

No serological evidence of CMV infection. Results may be negative early in acute infection.
In addition, CMV IgM may sometimes not be detectable at all in recent infection if the patient is immunosuppressed.
Suggest repeat testing in 2 to 4 weeks if clinically indicated.

EBV SEROLOGY

EBV (NA) IgG Antibodies: Not Detected

EBV (VCA) IgG Antibodies: Equivocal

EBV (VCA) IgM Antibodies: Not Detected

EBV Comment:

Serological status cannot be determined. Suggest repeat testing in 14 days.

VZV SEROLOGY

VZV IgG Antibodies: Not Detected

VZV Comment:

No serological evidence of past VZV infection or immunisation. Commercially available laboratory tests are not always sufficiently sensitive to detect low antibody levels following vaccination.
If there has been significant exposure to VZV, Zoster immunoglobulin should be given to non-immune pregnant women, non-immune neonates or significantly immunosuppressed individuals within 96 hours, as detailed in the Australian Immunisation Handbook. Please contact a Clinical Microbiologist if there are any queries about this result.
