Addressee: NICHOLSON, Dr Claudia Referred by: Dr CLAUDIA NICHOLSON

Name of Test: CT Abdomen and Pelvis with Contrast
Requested: Collected: 3/05/2021 4:42:00 PM Reported: 3/05/2021 5:23:00 PM

EXAM: CT Abdomen and Pelvis with Contrast

Clinical Indication:

Left lower quadrant discomfort.? Diverticulitis

Findings:

CT abdomen and pelvis after intravenous and oral contrast.

Comparison made to the previous CT abdomen and pelvis of 07/01/2017.

The 17 x 10 mm hypodense lesion in segment VIII of the liver with multiple foci of calcification is unchanged. There are also multiple small hepatic cysts which are unchanged. The gallbladder and biliary tree are normal. The pancreas, adrenal glands, spleen and kidneys are normal. There is no abdominal or pelvic lymphadenopathy. There is a right hip replacement causing metallic streak artefact obscuring the pelvis. There is mild uncomplicated sigmoid diverticular disease. There is no evidence of acute diverticulitis. There is a small fat containing umbilical hernia.

The visualised lung bases are clear apart from mild atelectasis.

There are no suspicious osseous lesions.

Impression:

Mild uncomplicated sigmoid diverticular disease. No evidence of acute diverticulitis. No specific cause for the patient's symptoms identified.

Thank you for referring this patient.

Electronically Signed by: Dr Melvin Wong
