BILATERAL BREAST ULTRASOUND

Clinical History:

Left breast cyst. Has implants.

Findings:

Comparison has been made with the breast ultrasound performed on 03/04/2020.

Right Breast

No solid or cystic lesion.

At 6 o'clock, 4 cm from the nipple, there is irregularity of the implant capsule measuring up to 22 mm in length. There is a 5 mm curvilinear echogenic focus in the adjacent breast tissue with posterior acoustic shadowing, consistent with a region of calcification. These changes appear new.

Left Breast

At 2 o'clock, 1 cm from the nipple, there is redemonstration of a well-circumscribed, slightly lobulated, ovoid, hypoechoic, avascular lesion measuring 7 x 10 x 5 mm (previously 7 x 5 x 9 mm). There is no posterior acoustic enhancement or shadowing.

At 2 o'clock, 10 cm from the nipple, note is made of an intramammary lymph node measuring 5 x 6 x 3 mm. This has a normal fatty hilum and feeding vessel. Normal appearance of the implant on this side.

IMPRESSION

Possible disruption of the right breast implant capsule at 6 o'clock, 4 cm from the nipple. MRI would be best for assessment of implant integrity.

Stable size and appearance of the 7 x 10 x 5 mm lesion in the left breast at 2 o'clock, 1 cm from the nipple. As suggested previously, this is most likely a fibroadenoma.

Dr Martina Preda
