X-RAY PELVIS/RIGHT HIP AND ULTRASOUND RIGHT HIP

CLINICAL HISTORY:

Right hip pain, worse when lies on this side at night.

FINDINGS:

X-RAY PELVIS/RIGHT HIP

Mild joint space loss associated with mild marginal osteophyte formation involves the hip joints in keeping with mild bilateral OA. Similar mild OA involves the sacroiliac joints. Incidental note is made of a right os acetabulum.

ULTRASOUND RIGHT HIP

There is no evidence of a hip joint effusion.
The insertion of the iliopsoas and origin of the rectus femoris tendons are unremarkable.
The gluteus minimus tendon is intact.
The gluteus medius tendon demonstrates a complete full thickness rupture with a proximal retraction of 30mm. This is associated with bursitis.
The greater trochanteric bursa is not thickened and is non-tender.
No abnormality is seen within the tensor fascia lata or iliotibial band.

COMMENT:

Full thickness tear of the gluteus medius tendon associated with greater trochanteric bursitis.

Thank you for your referral.

Yours sincerely,

Dr Ryan Kong
MBChB FRANZCR

Sonographer: MP
