ULTRASOUND RIGHT HIP

CLINICAL INFORMATION:

Intermittent right hip pain.

FINDINGS:

Comparison is made with the previous ultrasound dated 24/02/2022. The previously seen gluteus medius tear currently measures 20 x 12mm (14mm previously). There is also tendinosis of the residual tendon fibres. The gluteus minimus tendon is unremarkable. The greater trochanteric bursa measures 1mm and is non-tender. No abnormality is seen at the anterior aspect of the hip joint.

CONCLUSION:

Chronic tear of the gluteus medius tendon, currently measuring 20 x 12mm on a background of tendinosis.

Thank you for your referral.

Yours sincerely,

Dr Edward Nganga
MBChB, MMed Rad.

Sonographer: MP
