Referring Practitioner: Dr Shirley TANG

Patient Name: Maxine POLISTENA

D.O.B.: 20-06-1955, PID: 41162

Procedure Date: 02 March 2023

CT LUMBAR SPINE AND PELVIS

Clinical Notes: Progressive lower back pain and hip pain.

Technique: Non-contrast CT of the lumbar spine and pelvis.

CT LUMBAR SPINE

Findings: At L5/S1, some circumferential disc bulge with ligamentum flavum and facet hypertrophy is noted. There is narrowing of the right L5 exit foramen and possible impingement of the traversing right S1 nerve. Elsewhere, no suggestion of neural impingement throughout the lumbar spine on CT. Vertebral endplates and body heights are preserved. No antero or retrolisthesis. Advanced facet degeneration noted at L4/5 and L5/S1. No focal destructive osseous process.

Conclusion: Some narrowing of the right L5 foramen and possible impingement of the traversing right S1 nerve. Prominent facet arthropathy in L4/5 and L5/S1. Clinical correlation would be helpful.

CT PELVIS

Findings: The pelvic bones and proximal femora are intact. No focal destructive osseous process. Hip joints demonstrate relatively mild osteoarthritis, symmetrical in severity. Sacroiliac joints are symmetrical.

Dr Senpei Jin
MBBS MMed FRANZCR
