Comments on Lab Id: 670365094

The presence of coeliac disease is very unlikely (<5%).
If suggestive symptoms, signs or family history, coeliac tissue typing or
endoscopy may help exclude the disease further.

Comments on Collection 670365094

Not detected results indicate the absence of detectable nucleic acids in this sample for the enteropathogens reported. Only the reported enteropathogens have been tested.

All bacterial causes of gastroenteritis reported by PCR are cultured for recovery of isolates subject to organism viability and a further report issued. Some clinical indications e.g overseas travel, eosinophilia, seafood or antibiotic ingestion will require additional parasite concentration examination, culture setup or molecular testing to detect alternative pathogens e.g. hookworm, strongyloides, Vibrios, Clostridium difficile infection (CDI), Enterohaemorrhagic E. coli (STEC). These indications should be highlighted on the request.

Roche LightMix Gastroenteritis multiplex PCR assays were utilised for testing.

For further enquiries regarding these results please contact Dr Jenny Robson or Dr Sarah Cherian (07 3377 8534).

Calprotectin Faeces	<1	30	(<50)	mg/kg

Comments on Collection 23-Jan-23 1332:
Elevated faecal calprotectin indicates a high probability of intestinal

inflammation. Levels of faecal calprotectin above 250 mg/kg have greater positive predictive value especially in children. For patients with known inflammatory bowel disease in remission, faecal calprotectin above 50 mg/kg is associated with an increased risk of relapse over the next 12 months. In patients with faecal calprotectin levels below 50 mg/kg with strong clinical indications of intestinal inflammation, a repeat sample may be useful. In small bowel Crohn's the faecal calprotectin may be within the normal range. Many conditions including bowel cancer, NSAID ulceration, coeliac disease, diverticulitis and chronic inflammation may cause elevated faecal calprotectin. This test has not been validated in children under two years of age. Testing performed by FEIA.

Please be advised that as of November 1st 2021 the medicare schedule for faecal calprotectin testing has changed.

If all of the following five criteria have been met, no out of pocket fee will be charged -

1. The patient is under 50 years of age
2. The patient has gastrointestinal symptoms suggestive of inflammatory or functional bowel disease of more than 6 weeks duration
3. Infectious causes have been excluded
4. The likelihood of malignancy has been assessed as low
5. No relevant clinical alarms are present

All patients over the age of 50 will be charged the non-rebateable fee.

Comments on Collection 13-Feb-23 1011:
Negative result indicates hCG level at present less than 5 IU/L.

A negative pregnancy test in the first two weeks following missed menses does not absolutely exclude pregnancy. A repeat test should be performed if so indicated.

Radiology Report

Procedure:

US abdomen and pelvis

History:

ORIF discharge. Lower abdominal pain

Findings:

Abdomen

The liver is normal in size. The liver parenchyma shows normal echogenicity. No suspicious hepatic lesion is detected. The portal vein is patent and shows hepato-petal flow.

The gallbladder appears normal with no calculus or wall thickening seen.

There is no biliary dilatation.

The spleen is normal in length and no focal splenic lesion is seen. The visualised part of the pancreas is unremarkable.

Both kidneys are normal in shape and echogenicity. No hydronephrosis, calculus or other focal lesion is demonstrated.

No aortic aneurysm is seen.

Pelvis

Transabdominal and trans vaginal examination of the pelvis were performed with the patient's consent.

The uterus measures 42 cc in volume and is anteverted. No focal lesion is seen.

The endometrial lining measures 3 mm and is uniform in thickness. The IUCD appears correctly positioned.

Both ovaries appear normal with numerous follicles.

No adnexal mass lesion or free fluid is seen.

Conclusion:

Normal abdominal and pelvic ultrasound.
