MRI BRAIN AND CORD

Clinical Notes:

On Tecfidera.

MRI brain and cervicothoracic cord has been performed as per demyelination protocol. Comparison made to earlier examinations the most recent 7th of September 2022. There is no new posterior fossa lesion. Similarly there is a stable appearance to the mild burden of supratentorial disease. No new lesion is identified. Ventricular size and sulcal pattern are unaltered. No restricted diffusion. No other findings of note.

MRI

CERVICOTHORACIC SPINE

There has been no change in the mild burden of cervicothoracic cord disease. No lesion is identified. Cervicothoracic cord volumes well maintained. There is no significant spondylotic narrowing in the central canal. Normal marrow signal. No infiltrate.

CONCLUSION:

Stable appearance since previous examination from 7th of September 2022. No new lesions to suggest disease activity.
