THYROID SCAN 25/11/2022 Reference: 4266924

THYROID SCAN

CLINICAL HISTORY:
Hyperthyroidism.

No previous scans were available for comparison.

FINDINGS:

The thyroid gland appears normal in size. There is no retrosternal extension with the neck extended. There is a diffuse increase in tracer uptake within both thyroid lobes. Tracer uptake extending superiorly from the thyroid gland in the midline most likely reflects uptake in a pyramidal lobe.

No discrete hot or cold nodules are seen.

The overall percentage of tracer uptake is 10.8% (normal range 0.5-4%).

INTERPRETATION:

In the context of hyperthyroidism, the scan appearance is typical of Graves' disease.

Radiologist: Dr D. Cohn

Mater Imaging is following the advice provided by the Department of Health and NSW Health to help prevent the transmission of Coronavirus (COVID-19). During this time, we will continue operate our normal hours.
