Comments on Collection 01/02/23 1355:

Clinical status and cardiovascular risk factors should be taken into consideration when interpreting this result. Repeat measurements after 2-4 hours from baseline may improve the clinical specificity of the test.

Please note from 14/04/19, this assay is performed on an Abbott Alinity and the reference ranges have been changed accordingly.

A negative D-Dimer test result, with a low clinical pre-test probability, excludes DVT. Correlate with clinical probability and other investigations.

Dear Stephen

Re: Irena Zdzinski DOB: 28/03/1985
Medicare: 5081216348 Ref: 4 Expiry: 31/10/27

Diagnoses:

>Non cardiac chest pain

Medications:

>Nil

Irena's CT showed pristine arteries, zero calcium, no aberrancy, no plaque or stenosis. Her echo showed a structurally normal heart. She chose not to start Celebrex as she is very tablet sensitive. She has seen an immunologist.

She tells me she has previously had negative gall bladders scans and she has obviously had a normal CTPA. While we have not exactly diagnosed the cause of her pains, I suspect a musculoskeletal origin. She does feel a Voltaren occasionally helps and she can tolerate this so she is welcome to stick with that. At least, we have happily excluded a cardiovascular cause for symptoms.

Yours sincerely

Dr Ivan Straznicky
Cardiologist
