## ANTINUCLEAR ANTIBODY SEROLOGY

**TITRE** **PATTERN**  
**1:640** **Dense Fine Speckled**

A high titre ANA is present. Testing for anti-dsDNA and ENA is suggested in patients with suspected autoimmune disease. A high titre ANA may be found in a proportion of well individuals without clinical autoimmune disease where dsDNA and ENA tests are found to be negative.

Dense fine speckled ANA patterns are predominantly associated with antibodies against a 70 kD protein (DFS70 or LEDGF). Isolated DFS70 antibodies have been reported to be more prevalent in healthy adult individuals than in patients with systemic rheumatic disease. Although the presence of anti-DFS70 does not exclude the presence of autoimmune disease, the likelihood is significantly lower than in patients with other ANA patterns.

The significance of isolated DFS70 antibodies in children is unknown. Anti DFS70 antibodies can be confirmed on request. Testing for DNA, ENA, Rheumatoid Factor, CCP and thyroid antibodies should be performed to exclude the presence of other autoantibodies.
