Many thanks for asking me to see Ronald regarding his episodes of haematuria. These occurred on consecutive mornings and since then things have been clear. I note he takes Eliquis because of his coronary artery bypass grafts. He has very significant symptoms of bladder outflow obstruction with a weak intermittent stream. His medication list includes tamsulosin which he has taken sporadically. The ultrasound study certainly showed evidence of bladder wall thickening but he did empty well with a residual of 29ML.

Examination confirms some tenderness in the right lower quadrant, normal genitalia and his prostate is moderately enlarged and clinically benign.

I have explained the importance of a cystoscopy to exclude urothelial malignancy and I will perform that for him under LA tomorrow afternoon.

With kind regards

Yours sincerely

Flexible cystoscopy on Ronald this afternoon showed no sign of anything worrisome. He has lots of tiny fibroepithelioid polyps on the surface of the prostate which are harmless and usually suggest a previous episode of inflammation. Bladder surfaces were healthy.

I will happily see him again if he has ongoing problems. I have reassured him of today's findings.

With kind regards

Yours sincerely
