Anti-Mullerian Hormone

Anti-Mullerian Hormone	*	**32.0**	pmol/L	(14-30)

Comment
Assay performed using the Beckman Coulter Access2 method as of 04/11/2014.
The reference values quoted remain unchanged.

<14.0 pmol/L: Suggestive of reduced ovarian reserve
>30.0 pmol/L: Indicates the possibility of
1. Polycystic Ovarian Syndrome
2. Increased risk of Ovarian Hyperstimulation Syndrome in a stimulated cycle
3. In post menopausal females - granulosa cell tumour

AMH is produced by the granulosa cells of developing follicles, and provides an estimate of the number of primordial follicles. A low AMH level (below the 25th percentile for age group) does not exclude the possibility of fertility, particularly in younger women.
The optimal time for AMH collection is around day 6 of the menstrual cycle, as levels decrease later in the cycle. Levels are also decreased by the OC pill.

AMH graph to follow this report.
Reported by Sullivan and Nicolaides Pathology, a member of the Sonic Healthcare Group.
