

Patient First Name:	Joanna	Patient Last Name	Giakoumatos
Patient DOB:	5-Sep-1995	Patient Gender	Female
Practitioner Name:	Dr Ameeta Gajjar	Type of Test Performed:	Lactulose
Date Samples Collected:	29-Jul-22	Date of Analysis:	10-Aug-22

Data

#	Sample	ppm H ₂ (Hydrogen)	ppm CH₄ (Methane)	Combined	CO ₂ %
1	Baseline	2	2	4	3.5
2	20 min	2	2	4	3.5
3	40 min	3	2	5	3.4
4	60 min	3	2	5	3.5
5	80 min	3	1	4	3.7
6	100 min	3	2	5	3.4
7	120 min	5	2	7	3.5
8	140 min	13	5	18	3.4
9	160 min	32	8	40	3.3
10	180 min	43	12	55	3.3

Interpretation	Reference Ranges	Your Test Results	
SIBO Suspected – Elevated Hydrogen	Increases of hydrogen greater than 20ppm over the lowest preceding value within the first 100 minutes are indicative of bacterial overgrowth. Levels between 100-120 minutes are considered borderline. See additional interpretation	NEGATIVE	
SIBO Suspected – Elevated Methane	Increases of methane greater than 12ppm over the lowest preceding value within the first 100 minutes are indicative of bacterial overgrowth. Levels between 100-120 minutes are considered borderline. See additional interpretation	NEGATIVE	
SIBO Suspected – Elevated Combined hydrogen & methane gasses			

Patient reported no improvement of symptoms while on the preparation diet

Patient reported symptoms of eructation during testing

Additional Information and Interpretation

- Hydrogen Baseline Reading should read below 10 ppm if performing a the Methane Spot Retest and disregarded if performing the Constipation Breath Test.
- · Methane Spot Retest Methane levels are considered in relation to the previous Lactulose breath test baseline reading to monitor treatment efficacy.
- · Constipation Breath Test Methane is high if reading is >10 ppm.
