Action : in view of history, cover for bacterial infection

cetirizine & singulair to stop mucus production

A/B + AZITHROMYCIN 200MG/5ML SUSPENSION (ZITHROMAX)(15ML) - DOS:3ML FEQ:1 DAY:5 QTY:1.00

MONTELUKAST 4MG ORAL GRANULES (SINGULAIR) - DOS:1S FEQ:1 DAY:7 QTY:7.00

CETIRIZINE 1MG/ML SYRUP (ADEZIO)(60ML) - DOS:2.5ML FEQ:1 DAY:7 QTY:1.00

ZZZ DIPHENHYDRAMINE 10MG/5ML SYRUP (UNI-PHEN), 120ML - DOS:2.5ML FEQ:3 DAY:5 QTY:1.00

[YVONNE]

13 April, 2007

Diagnosis : Dry skin, Essential vaccination

Findings : slightly dry skin

strawberry haemangioma back

heart sounds normal

PHYSIOGEL CREAM (75ML) - DOS:LA FEQ:2 DAY:7 QTY:1.00

≥ 32

Negative
Weakly Positive
Positive

Reference Notes:

M. pneumoniae is an important respiratory tract pathogen of human. Often nicknamed as "walking" atypical pneumonia, the most frequent clinical symptoms start with fever, sore throat, headache and malaise 2-4 days before the onset of respiratory symptoms. Most cases do not require hospitalization, and pneumonia develops in only 5-10% of persons who are infected and about 25% of M. pneumoniae infections are asymptomatic. It is easily spread in the household. Incubation period is 2-3 weeks. Patients with a low IgG titre and no IgM should have a convalescent specimen collected 2 weeks later. The presence of IgM antibodies or a 4 fold or greater rise in IgG antibody between paired sera indicates recent infection. A negative titre cannot rule out infection and for diagnosis, and clinical symptoms should always be taken into account alongside the serological results.

XR CHEST (23.1.2008)

CLINICAL INFORMATION:

Fever for 1 week.

REPORT:

Cardiac size cannot be commented due to supine position.

The lung fields are clear.

There is no definite consolidation to suggest pneumonic change seen.

There is no hilar enlargement or pleural effusion seen.

The soft tissues and the bony structures appear normal.

COMMENT:

Normal study. No definite consolidation to suggest pneumonic change is seen.

	Very high level	≥ 100	6

This test is an FDA approved third generation (3g) allergy test using the DCP Immulite chemiluminescent technology. It provides quantitative determination of allergen-specific IgE at very low levels. For children under 2 years old, it is recommended that food allergens be tested (Children's 3g Allergy Profile) and on older children and adults inhalant allergens as well (South China 3g Allergy Profile).
