Cytomegalovirus (CMV) Serology

CMV IgG (CLIA)	Positive
CMV IgM (CLIA)	Positive

Comments

Result consistent with current Cytomegalovirus (CMV) infection

This result may indicate:

1. Recent infection with CMV (either primary infection or reinfection)
2. Reactivation of latent infection.
3. A non specific response due to infection with another organism eg. 30% of patients infected with EB virus may exhibit a positive CMV IgM. In these situations the CMV IgM is transient, persisting for a much shorter period than in 1 or 2.
