Cytomegalovirus Viral Load

Specimen	Plasma
CMVL DNA	CMV DNA detected *
CMV Viral Load	46.5 IU/mL
CMV Log Viral Load	1.7 IU/mL

Comments

The linear range for CMV viral load is 34.5 (log 1.5) - 10,000,000 (log 7.0) IU/mL and the limit of detection is 34.5 IU/mL. Viral loads greater than 27,300 IU/mL (log 4.4) can indicate a high risk of CMV disease. Stable low levels indicate CMV replication in an immunocompromised host but will not necessarily indicate CMV disease.

CMV viral load assay was performed using the Roche cobas CMV quantitative test on the cobas 6800 System.
For further enquiries regarding these results please contact Dr Jenny Robson or Dr Sarah Cherian (07 3377 8534).
