## C Reactive Protein

| Test Name | Result | Units | Reference Interval |
|-----------|--------|-------|--------------------|
| CRP       | 2.1    | mg/L  | <5                 |

## Comments

Interpretation: Elevation in CRP indicates disease activity of an inflammatory, infective or neoplastic nature. CRP is a more sensitive early indicator of an acute phase response than is the ESR. It also returns towards normal more rapidly with improvement or resolution of the disease process.

Artefactually decreased CRP values occur when patients are treated with antibiotics containing carboxypenicillins including Ticarcillin.
