ANA IFA SCREEN W/RFLX TO TITER/PATTERN

Collected on June 13, 2024 5:25 PM

If you have questions or concerns regarding your test results, contact the clinician who ordered the test. ▼

Lab tests - Serum (Blood)

Results

ANA Scrn, IFA
Normal value: Neg

Value
Neg

Anti-nuclear antibodies (ANA) are present in a variety of autoimmune connective tissue diseases and are determined by indirect fluorescence assay (IFA) using HEp-2 cell substrate with an IgG-specific conjugate. ANA titers less than or equal to 1:80 have variable relevance. Titers greater than or equal to 1:160 are considered clinically significant.

A negative ANA by IFA does not rule out the presence of connective tissue disease.

The ANA test is intended to be used as an aid in the diagnosis of various systemic autoimmune disorders. Correlation of ANA results with clinical findings and other laboratory data is recommended.

Authorizing provider: Gunnar Roll, PA
