Test Name	Result	Units	Reference Interval	Comment
Ferritin.	83	ug/L	20 - 160	
● Iron.	<b>30 H</b>	umol/L	7 - 26	<b>HIGH</b>
Transferrin	2.8	g/L	2.0 - 3.6	
● Saturation.	<b>47 H</b>	%	15 - 45	<b>HIGH</b>

#### Comments

Laboratory records show a Haemochromatosis Gene Test has been performed in a previous episode and is heterozygous for the C282Y and H63D mutations i.e. compound heterozygous. Clinical correlation is required.

## SEROLOGY

Specimen Type: SERUM

Syphilis Antibody

NON-REACTIVE

## Comments

No serological evidence of Treponemal infection (syphilis, yaws or pinta).

Serology may be negative in the early stages of syphilis. If recent infection is suspected, consider swabbing the base of any ulcer that is present for syphilis PCR and repeating serology in 2 - 4 weeks.

Syphilis serology is recommended for pregnant women at their first antenatal visit and repeated at 26-28 weeks gestation and for anyone as part of a routine STI screen or in the presence of a clinically compatible illness.

Please refer to [sti.guidelines.org.au](http://sti.guidelines.org.au) for further testing information.

### Blood Bank Serology

**Blood Group** A Rh(D) Positive

**Antibody Screen** No antibodies detected.

### Comments

It is recommended that a BLOOD GROUP and ANTIBODY SCREEN be performed on all pregnant women in the FIRST TRIMESTER and at 28 WEEKS gestation. The blood sample should be taken prior to the administration of Rh(D) Immunoglobulin.
