Ph: 07 5450 2950

ULTRASOUND PELVIS

FINDINGS

Transabdominal and transvaginal imaging of the pelvis.

Midline anteverted uterus. Normal in size, 69cc, length 8.6cm. Endometrial width uniform and normal at 9mm with trilaminar appearance consistent with mid cycle.

Both ovaries are bulky, right 15.3cc, left 10cc. Polyfollicular ovaries, more than twenty at the left side and right side. Both are tender with probe pressure (mild) and both were mobile.

Trance amount of free fluid in the pelvis. No adnexal mass. Bowel moves freely over the uterine fundus.

COMMENT

Polyfollicular ovaries. This can be a normal finding in this age group. It can be seen with polycystic ovarian syndrome and therefore needs to be correlated with any clinical or biochemical features which might suggest that disorder.

Thank you for referring this patient.
