MRI LUMBAR SPINE 06/09/2024 Reference: 16579303

MRI LUMBAR SPINE

**HISTORY:**

Right lumbar back pain for many months. Radiculopathy L5/S1 ?.  
Spondylolisthesis ?.

**FINDINGS:**

Alignment is normal. There is no fracture. No abnormal bone marrow oedema.

The distal cord and conus have a normal appearance.

The upper lumbar intervertebral discs appear normal.

L4/5: There is slight loss of disc height. There is broadbased right paracentral disc protrusion extending posteriorly by 4mm. There is effacement of the lateral recess, more marked on the right, with compression of the descending right L5 nerve root. There is minimal foraminal narrowing.

L5/S1: There is disc desiccation with loss of disc height. There is a tiny posterocentral annular fissure. No canal or foraminal narrowing.

COMMENT:

- \* There is a moderately large broadbased right paracentral disc protrusion at L4/5. This effaces the lateral recess, more severe on the right. There is compression of the descending right L5 nerve root.
- \* There is also mild disc degeneration at L5/S1 with posterior annular fissure, but no neural compressive lesion at this level.

Dr Andrew Carter

Electronically verified by: Dr Andrew Carter - 06/09/2024 12:48

Echocardiography now at available at PRP Warriewood.
