Low Positive		20-39		
Moderate Positive		40-79		
High Positive		>80		

Most patients with Anti-Phospholipid Syndrome (thrombosis, recurrent foetal loss, thrombocytopenia and phospholipid Abs) have moderate to high IgG cardiolipin levels; IgM Abs are less specific. B2GP1 IgG Abs are more specific and less sensitive. The lupus anticoagulant test may detect other phospholipid Abs. Diagnosis of APS requires persistence of phospholipid Abs for more than 12 weeks confirmed by repeat testing and correlation with clinical findings.

Methylene Tetrahydrofolate Reductase Gene Mutation

MTHFR c.665C>T Not Detected

MTHFR c.1286A>C Homozygous

Comment on Lab ID 465747201

Homozygosity for the c.1286A>C variant is not associated with disease. This finding is of little clinical significance (Genet. Med. 15, 153-6, 2013).

MTHFR test information:

Detection of the c.665C>T and c.1286A>C variants of the MTHFR gene is performed by melt curve genotyping PCR using the Tib Molbiol MTHFR C667T and MTHFR A1298C Light mix IVD kits.
Other variants in the MTHFR gene are not tested and therefore will not be identified.

Prothrombin Gene Mutation NOT DETECTED

Comment on Lab ID 465747201

Heterozygotes for one mutation have a moderately increased thrombotic risk of 3-8 fold for G1691A and 2-5 fold for G20210A. Patients with two mutations (homozygous for either mutation or heterozygous for both mutations) are at higher risk of thrombosis than heterozygotes for one mutation. Other non-genetic factors may also affect thrombotic risk.

Testing should be offered to family members of patients with either mutation. Genetic counselling may be appropriate.

Test information:

Detection of the G20210A and G1691A mutations is performed by melt curve genotyping using the TibMol Bio Factor II G20210A and Factor V (Leiden) Lightmix IVD kits. Other variants in the F5 and F2 genes are not tested.

Results for both prothrombin gene and Factor V Leiden analysis are reported for all requests for either test as both may contribute to thrombotic risk.

HGVS nomenclature:

G1691A in the F5 gene is LRG_553:c.1691G>A

G20210A in the F2 gene is LRG_551:c.*97G>A.

Comments on Collection 24/04/24 0818 F:

Anti- Tissue transglutaminase IgA and anti-Gliadin IgG beween 7 and 10 U/mL are considered equivocal. Avoidance of dietary gluten (wheat) may result in false negative results. A gluten challenge prior to testing may be useful in some patients. A duodenal biopsy may be required for confirmation.

	Units	Reference
HbA1c (NGSP)	5.3	% (4.0-6.0)
HbA1c (IFCC)	34	mmol/mol (20-42)

 Comments on Collection 24/04/24 0818 F:

In a symptomatic patient an Alc $\geq 6.5\%$ (48 mmol/mol) is diagnostic of diabetes. In an asymptomatic patient, a positive test should be repeated.
 Med J Aust 2012; 197 (4): 220

The ADS provides individualised targets for known diabetics. These are available at:
<http://www.diabetessociety.com.au/downloads/positionstatements/HbA1ctargets.pdf>

Note: Conditions of shortened red cell survival may cause a misleading decrease in HbA1c. ie. B12/Folate deficiency, recent transfusion, haemoglobinopathy, haemolysis, cirrhosis, liver disease and renal failure. Iron deficiency anaemia causes a misleading increase in HbA1c.

HbA1c performed on the Sebia Cap3 analyser by capillary electrophoresis.
