Comments

A small percentage of patients with TSH receptor antibody (TRAb) negative Graves Disease may have identifiable Thyroid Receptor Stimulating Immunoglobulin (TSI).
TSI (Medicare rebatable) has been added for further information .

TSI (Thyroid Stimulating Immunoglobulin) represent thyroid receptor antibodies that do not have receptor blocking activity.

Thyroid Antibodies: Levels up to 100 IU/mL can occur in normal subjects (5% of males, 15% of females - mainly elderly) and may also occur in non-thyroid autoimmune and chromosomal disorders.

Raised levels may occur in prodromal hypothyroidism before TSH elevations occur and may also be seen in thyrotoxicosis, thyroiditis, non-toxic goitre and thyroid cancer. The levels seen in Graves' Disease and Hashimoto's can vary from normal up to >1000, but are usually elevated.
