

LAB REPORT

NAOMI FISHER (F) 20/01/2025

Patient Details AGE (DOB): 25/05/1981 ORDER NUMBER: U9J7Q20 SAMPLE ID: 2412130006	Specimen Details TYPE: PERIPHERAL BLOOD RECEIVED: 14/01/2024 CONDITION: ACCEPTABLE (GOOD)	Partner Details NAME: JAMES STRAY AGE (DOB): 08/04/1980 GENDER: MALE
---	---	--

REPRODUCTIVE IMMUNOLOGY AUTOIMMUNITY TESTING

NK cell profile/Regulatory T-Cell assay (Tregs)	Your Result	Ref. Range
CD56+/CD16+ NK lymphocytes	8.29%	<12.0
Regulatory T-Cells (Tregs)	0.77%	>0.8

INTERPRETATION OF RESULTS AND RECOMMENDATIONS: LOW RISK

DIAGNOSIS:	LOW RISK AUTOIMMUNITY DYSFUNCTION DETECTED
DESCRIPTION:	The results of the autoimmunity dysfunction test so far demonstrate a normal immunological profile with the exception of marginally low levels of Regulatory T-Cells (Tregs) . Tregs are essential mediators of the immune tolerance required to initiate pregnancy and a diminished Treg population may fail to effectively suppress pro-inflammatory Th1 immune responses, compromising the embryo’s ability to evade maternal immune rejection.. However, yours are only marginally reduced and thus considered of lower clinical significance.
TREATMENT:	Treatment is optional and may not be required strictly based on the above results. Your healthcare provider may consider anti-inflammatory and immune-modulating treatments in relation to your overall fertility clinical and laboratory testing profile. Options such as Lymphocyte Immunization Therapy (LIT) and/or Intralipid treatment could be evaluated as potential interventions tailored to address the observed immunological profile. This approach aims to optimize the balance of immune responses and enhance the likelihood of successful reproductive outcomes. The decision to pursue such treatments should be carefully discussed and personalized based on your individual health status and reproductive history.
RETESTING:	During or following treatment, retesting is optional to evaluate therapeutic efficacy. At your doctor’s discretion, continued monitoring may be advisable to ensure ongoing vigilance regarding your immunological status during pregnancy.

REPRODUCTIVE IMMUNOLOGY ALLOIMMUNITY TESTING

Leukocyte antibody detection (LAD) (crossmatch)	Result	Ref. Range
T cells (IgM)	Negative	positive
T cells (IgG)	Borderline increase	positive
B cells (IgM)	Negative	positive
B cells (IgG)	Borderline increase	positive

- For results identified as positive, the percentage of positive T or B cells will be reported.

HLA DQA-1 high resolution (2-field) typing analysis

Allele 1	DQA1*01:02 (Partial Match detected)	no matching
Allele 2	DQA1*02:01 (No Match detected)	no matching

It does not constitute medical advice or counselling, it does not represent a medical examination by itself, nor it is a substitute for medical advice or medical treatment and should not be considered in any way as prescriptive. The results and the information in this test have not been approved by any official body to be used directly for diagnostic testing and the medical information contained herein is not intended as a substitute for conventional medical testing used for diagnosis and treatment. The information contained in this document is intended for use by a healthcare professional and the recipient of this report should always either consult with their treating physician, regarding medical diagnosis and treatment, or seek the advice of a qualified health care professional, concerning personal health and medical conditions. Each treatment must be prescribed by a qualified medical doctor, as medical treatments may have negative side effects. Upon receiving the results of the test, only a treating physician should decide whether treatment is required and which is the correct treatment for the patient, based on the patient's clinical history, additional medical results, known allergies and other relevant medical data. Further suggested diagnostic testing may only take place in a licensed medical facility by healthcare professionals and under circumstances approved by medical law. In any case, FERTILYSIS will not be liable for damages and claims due to improper use or misinterpretation by the party ordering the test (contracting party) both of the information contained in this report and of the company's services in general.

LAB REPORT

Partner Allele 1
Partner Allele 2

DQA1*01:02 (Partial Match detected) no matching
DQA1*03:01 (No Match detected) no matching

Maternal KIR typing	Possible genotype	Result	
The following genotype is likely for the patient:	2DL1, 2DL2, 2DL3, 2DL4, 2DL5A, 2DL5B, 2DS1, 2DS2, 2DS3, 2DS5, 3DL2, 3DL3, 3DS1, 2DP1, 3DP1	Genotype Bx (AB+BB)	Bx
Paternal HLA-C high resolution (2-field) allele group typing analysis		Possible paternal haplotypes	
Allele 1	C*03:04:15/03:04:32/03:118/03:172	C1	C1
Allele 2	C*14:22	C1	C1

INTERPRETATION OF RESULTS AND RECOMMENDATIONS: POTENTIALLY HIGH RISK

DIAGNOSIS:	POSSIBLE ALLOIMMUNITY DYSFUNCTION DETECTED
LAD:	The sample was negative or just borderline positive for anti-paternal antibodies. With a history of recurrent miscarriages, this result can be considered unfavorable for pregnancy, however, your doctor will decide on the significance of this result based on your fertility history.
HLA DQA1 Matching	You have a partial match with your partner. A partial HLA-DQα match between the two partners trying to conceive indicates a 50% chance of feto-maternal match and has been associated with reproductive immunopathology, such as recurrent spontaneous abortions (RSA), idiopathic infertility and implantation failure in both natural and assisted reproduction attempts.
KIR/HLA-C2 Mismatch	KIR/HLA-C genotyping is used to assess the compatibility between uterine NK KIRs and HLA-C of paternal origin presented by the embryo. Maternal KIR analysis of the patient indicates a low-risk genotype for infertility consistent with the KIR Bx (AB+BB) genotype. Parental HLA-C genotyping indicates no paternal HLA-C2 expression (C1/C1 genotype) which is considered a low-risk genotype for infertility. Overall, the combination of the above maternal and paternal genotypes is not considered a risk factor for infertility or recurrent pregnancy loss.
TREATMENT:	A partial HLA-DQα match, can lead to immune tolerance issues that may result in recurrent implantation failure (RIF) or recurrent pregnancy loss (RPL). This situation can be challenging to address, but specialized treatments and strategies are available that can significantly increase the chances of a successful pregnancy or, in some cases, bypass the issue entirely. A personalized approach that may include LIT, IVIg, Intralipid infusions, steroids or other specialized immune-modulating treatments in conjunction with close monitoring to assess treatment effectiveness and minimize potential medication side effects, is recommended. Each case should be assessed individually by an experienced reproductive immunologist or fertility specialist with expertise in immune-related infertility. These treatments aim to promote immune tolerance and improve the chances of successful implantation and pregnancy. <i>Note: Many of these treatments are still evolving, and research continues. It's essential for couples to consult with a qualified specialist to determine the best course of action based on their unique situation and the latest scientific evidence.</i>
RETESTING:	Following treatment retesting is optional. At your doctor's discretion, following LIT therapy, LAD re-testing may be advisable to evaluate therapeutic efficacy.
