Comments on Collection 15-Oct-24 1236:
Hepatitis C IgG may not appear for up to six (6) months after primary infection.
If this is acute phase serum, suggest repeat at a suitable interval.

No evidence of active Hepatitis B infection. If this is an acute sample then retesting in 60-90 days (range 45-180 days) post exposure is indicated.
For further information on serological events in acute (self-limiting) Hepatitis B infection see

Syphilis Antibody	Negative
-------------------	----------

Comments on Collection 15-Oct-24 1236:
No treponemal antibodies detected.
The Syphilis TP Chemiluminescent Microparticle Immunoassay (CMIA) is a

screening test for T.pallidum antibodies.

This result may indicate:

1. no exposure to T.pallidum.
2. very early primary syphilis. If risk factors exist a further sample should be tested in 2-3 weeks. In symptomatic patients, a swab of mucocutaneous lesions for the detection of T.pallidum DNA by PCR may be positive before antibody production commences.

Repeat antenatal syphilis screening for high risk subjects should be considered at 28-32 weeks gestation and at delivery.

HIV Ag/Ab

Negative

Comments on Collection 15-Oct-24 1236:

HIV-1/HIV-2 antigen/antibody assay performed by Abbott CMIA.

Approximately 50-90% of patients report signs and symptoms suggestive of primary HIV infection at the time of seroconversion, which mostly occurs at 10-14 days after exposure (range 3 days to 10 weeks). Onset of symptoms often coincides with the detection of HIV antigen/antibodies although testing can be negative for up to 3 weeks after symptoms develop. Negative results performed less than 12 weeks after exposure should be repeated at least 12 weeks after exposure to exclude transmission.

Comments on Collection 15-Oct-24 1236:
A low level of rubella IgG antibody (10-19 IU/mL) detected
suggesting past exposure or response to immunisation.

If future pregnancies are anticipated it is reasonable to boost
antibody levels with vaccination (after delivery) to reduce
susceptibility to rubella reinfection.

During pregnancy, if rubella contact has occurred, please notify
the laboratory to arrange rubella IgM testing on the current sample
and send a further serum 3-4 weeks after last contact or as soon
as illness develops.

According to the Position Statement 'Vitamin D and health in adults in Australia and New Zealand' MJA, 196(11):1-7, 2012, vitamin D status is defined as:

Vitamin D adequacy: >49 nmol/L at the end of winter
(levels may need to be 10-20 nmol/L higher at the end of summer, to allow for seasonal decrease.)
Mild vitamin D deficiency: 30-49 nmol/L

Assay Index Ranges:
Negative: <150 IU/mL
Positive: 150 IU/Ml

The uncertainty of measurement of this assay is +/-10% which equates to 135 to 165 at the cut-off of 150 IU/mL.

If clinical illness is suspected Varicella zoster is best diagnosed by swabbing the base of a lesion firmly for detection of VZV DNA by PCR (plain black dry swab).

VZV IgG testing is performed by CLIA.
