CT RENAL (CONTRAST)

#### CLINICAL HISTORY:

Right-sided lower thoracic back pain radiating to right upper quadrant history of low-grade bladder cancer and renal and ovarian cysts

#### FINDINGS:

Multiphase spiral series have been acquired through the abdomen and pelvis before and after IV contrast administration with multiplanar reformations.

There is a single 4 mm calculus within the right kidney. No ureteric calculi or hydronephrosis. No ascites or localised fluid collection. There is a right ovarian cyst measuring 47 x 38 x 37 mm.

There is extensive colonic diverticular disease without evidence of acute diverticulitis. Mild faecal loading throughout the length of the colon. Small and large bowel loops otherwise outline normally.

Number of small low-density lesions within the liver likely represent cysts, the largest within segment 2 measuring 8 mm in diameter. The spleen, pancreas and adrenal glands outline normally. The gallbladder appears within normal limits and the biliary tree is not dilated. Both kidneys are also outline normally apart from the small calculus on the right side.

No apparent bladder mass on today's study. No urothelial lesion within the upper renal tract. No lymphadenopathy.

There is linear band of atelectasis within the right lung base. Degenerative disease is noted throughout the lower thoracic and lumbar spine.

#### COMMENT:

No evidence of metastatic disease related to the low-grade bladder cancer. Single small calculus within the right kidney. Extensive colonic diverticular disease. 47 mm right ovarian cyst which could be further characterised with an ultrasound examination. No other findings to account for the patient's symptoms.

Yours sincerely,

Dr. David Chadban
