Non reactive

Generated comment

In cases of possible HIV exposure, serology should be repeated in approximately 3 months.

The screening assay performed is an antigen/antibody combination test which detects HIV 1, HIV 2 antibodies and HIV P24 antigen.

Serum Vitamin B12

418 pmol/L 162-811

Serum Folate

43.3 nmol/L 8.4-55.0

Methodology:

Bv12 and Active Bv12(HoloTC) assays performed on Siemens Atellica analyser.

For Doctor clinical enquiries, please contact Dr Peter Davidson 07 3121 4444.
Patients should contact their referring doctor in regard to this result.

Comment

Serum Folate Assay:

Adequate Serum Folate.

In the absence of recent oral intake, a serum folate >13 nmol/L effectively rules out folate deficiency. Consider repeat fasting Folate, if there has been inadequate fasting, and clinical concern remains.

Serum Vitamin Bv12 Assay:

Essentially normal Bv12 levels, although liver disease if present may falsely elevate the level.

As part of our commitment to supporting you and your patients QML Pathology have been offering the service of Warfarin monitoring for over 40 years. If you wish for your patient to be managed by the Warfarin Care Clinic simply follow the guidelines to register their details.

Registrations can be completed by phoning 1300 795 355 (Monday to Friday, 9am to 4pm), or by using the editable PDF form found on the QML Pathology website. There is a cost to the patient so firstly check the patient has been made aware of, and agrees to the costs of this service. Continue to manage your patient until you have received confirmation that the registration has been accepted.

For ongoing patients always report to the Warfarin Clinic any health or medication changes. Alternatively, remind the patient to contact us immediately as this change may require a new test date and change in Warfarin dose.

cal heart valves and recurrent venous thromboembolism whilst on therapy.

Dosage controlled by patient's Doctor.

Blood HbA1c Fraction Ifcc

31 mmol/mol

Blood HbA1c Fraction

4.9 %

Note: Caution is needed in interpreting HbA1c results in the presence
of conditions affecting red blood cell survival times, which
may lead to either falsely high or falsely low HbA1c results.

HbA1c diagnostic levels - RCPA 2014

< 6.1% (<43 mmol/mol) - current diabetes is excluded
6.1-6.4% (43-47 mmol/mol) - high risk for future diabetes
> 6.4% (>48 mmol/mol) - diabetes is likely

Unless patient has supportive symptoms or elevated plasma glucose
values, repeat test is recommended.

Currently, Medicare will fund only one diagnostic test per year.

Sample may be collected at any time - fasting is not required.
Note - diabetes tolerance may be impaired by chronic illness,
use of certain drugs including steroids, Cushing syndrome, etc.
We would advise considering secondary forms in newly-diagnosed
patients.

 301 ANTINUCLEAR ANTIBODY SEROLOGY
 301
 301 Anti-nuclear antibodies Negative
 301
 301
 301 The ANA test is negative at the screening dilution of 1:80. A negative
 301 ANA excludes SLE in most cases. Consider ENA screening for patients with
 301 features of Sjogren's syndrome (to detect antibodies to SS-A which may
 301 co-exist with a negative ANA).
 301 Anti-dsDNA antibody testing is usually not warranted with a negative ANA
 301 unless the clinical suspicion of SLE is high.

Generated comment

Negative serology makes the diagnosis of untreated coeliac disease unlikely provided the patient is on a gluten containing diet.

If a strong clinical suspicion exists, genetic testing for coeliac disease (HLA DQ2/DQ8) should be considered. A negative result for DQ2/DQ8 makes the diagnosis of coeliac disease highly unlikely. A small bowel biopsy may be required in the event of a positive DQ2/DQ8 result.
