CUMULATIVE SERUM/PLASMA C-REACTIVE PROTEIN (CRP)

Date	30/06/23
Time	07:30
Lab No	72451908

CRP < 5 mg/L(0-6)

C-reactive protein (CRP) is a non-specific indicator of tissue damage.

The level rises rapidly (within 6-10 hours) after tissue injury, peaks at 48-72 hours and returns to normal within a few days. Common causes of markedly increased CRP include infection (particularly bacterial), trauma, surgery, myocardial infarction, many malignancies and inflammatory disorders.

**PELVIC ULTRASOUND**  
Sonographer: JS

**CLINICAL INFORMATION**  
Polycystic ovarian syndrome.

#### **FINDINGS**

No previous comparison imaging is available for review.  
Transabdominal and transvaginal pelvic ultrasound was performed with patient consent.

Anteverted uterus measuring 82 x 39 x 49mm, volume 81ml.  
Normal appearance of the myometrium.

The endometrium measures 11mm in AP thickness, consistent with the patients stage of menstrual cycle.

A small nabothian cyst is noted in the cervix.

The right ovary measures 36 x 30 x 26mm (volume 15ml). It contains a single follicle that measures 7mm. The ovary was mobile and nontender. The left ovary measured 37 x 18 x 19mm (volume 7ml). It contains four follicles, with a dominant follicle measuring 18mm. The ovary was mobile and nontender.

There is a moderate volume of simple fluid in the pouch of Douglas, possibly physiological or secondary to recent follicle rupture.

#### IMPRESSION

No polycystic ovarian morphology. Unremarkable appearance of the endometrium and myometrium.

Thank you for referring this patient

Comment:

Serum Folate Assay:  
Adequate Serum Folate.  
In the absence of recent oral intake, a serum folate >13 nmol/L effectively rules out folate deficiency. Consider repeat fasting Folate, if there has been inadequate fasting, and clinical concern remains.

Serum Vitamin B12 Assay:  
Essentially normal B12 levels, although liver disease if present may falsely elevate the level.

Methodology:  
B12 and Active B12 (HoloTC) assays performed on Siemens Atellica analyser.

As per ISLH guidelines - Film not reviewed. If a film review is truly indicated, contact the laboratory within 24 hours of collection. Otherwise investigate any highlighted abnormalities as clinically appropriate.

Mild Thrombocytopenia may be a transient effect of an acute infection. Persistent thrombocytopenia may be seen as a result of certain infections (e.g. EBV, HBV, HCV), Liver dysfunction, hypersplenism, Mild immune thrombocytopenia (ITP), drug side effect, SLE or APS, Pseudothrombocytopenia, and sometimes as a familial disorder, or in older patients an early myelodysplasia. (Note: In Pregnancy, mild gestational thrombocytopenia may be noted. However, this requires exclusion of these other causes). Correlate Clinically as well as with E+LFTs, Reticulocyte Count, Viral Serology, Coag Profile (Citrate count), and ANA if clinically appropriate. Otherwise, suggest repeat at a later date.

CUMULATIVE SERUM ANTI-MULLERIAN HORMONE (AMH)

Date 30/06/23  
Time 07:30  
Lab No 72451908

AMH 6.0 pmol/L (1.1-53.5)

There is no universally agreed AMH cut-off for the diagnosis of PCOS.  
Below 4.9 pmol/L - high risk (>60% chance) of low antral follicle count;  
Above 16.2 pmol/L - very low risk (<2% chance) of low antral follicle count.

Roche method in use.

Note - if the patient is currently taking a biotin-containing supplement, misleadingly low values may arise from interference with the test. These supplements should be ceased for at least 3 days prior to testing.
