Requested 20/04/2021
Collected 20/04/2021 00:00 AEDT
Received 20/04/2021 16:47 AEDT

Specimen No : 124705-21BR

FINAL DIAGNOSTIC SUMMARY:

1. GASTRIC BIOPSY:

- MILD CHRONIC GASTRITIS, AND MILD REACTIVE GASTROPATHY;
- HELICOBACTER NOT IDENTIFIED (SUPPLEMENTARY REPORT BELOW).

2. DUODENAL BIOPSY: NO SIGNIFICANT ABNORMALITY.

Reported by Dr James Bennett (Enquiries 7 3377 8656 james_bennett2@snp.com.au) 21/04/2021

Clinical Notes: Disacccs duodenal gastric - biopsy. Iron def

Macroscopic:

1. Labelled '**Gastric**'. Three portions of tan tissue 3-2mm. 1A in total.
2. Labelled '**Duodenal**'. Four portions of tan tissue 6-3mm. 2A in total.

Microscopic:

1. The sections show pieces of gastric body and antral type mucosa with a patchy mild increase in chronic inflammatory cells within the lamina propria, and minor vascular congestion. There is no significant active inflammation, and Helicobacter are not identified. Occasional oxyntic glands exhibit minor hyperplastic changes, suggestive of possible proton-pump inhibitor effect. Additionally, the antral mucosa exhibits features of a very mild reactive gastropathy pattern. There is no evidence of atrophy, intestinal metaplasia, dysplasia or malignancy.

Immunohistochemistry for Helicobacter is being performed, and a supplementary report will follow.

2. The sections show pieces of duodenal mucosa. The surface epithelium is stripped off in some areas, however where intact there appears to be a largely preserved villous architecture. There is no significant increase in inflammation within the lamina propria or surface epithelium. Granulomas or parasites are not seen. There is no evidence of dysplasia or malignancy.

Supplementary report (23/04/2021):

Immunohistochemistry for Helicobacter is negative (specimen 1).

Reported by Dr James Bennett (Enquiries 7 3377 8656 james_bennett2@snp.com.au) 23/04/2021
