C Reactive Protein

Test Name	Result	Reference Interval	Units
CRP	<0.4	<5	mg/L

Comments

CRP is a more sensitive early indicator of an acute phase response than is ESR. It also returns towards normal more rapidly with improvement or resolution of the disease process.

If CRP is elevated, it can indicate disease activity of an inflammatory, infective or neoplastic nature.

Artefactually decreased CRP values occur when patients are treated with antibiotics containing carboxypenicillins including Ticarcillin.

Random Urine Iodine

Test Name	Result	Reference Interval	Units
R-U-Creatinine	7.7		mmol/L
● Urine Iodine	56 L	> 100	ug/L
● Creat Corr. Iodine	74 L	> 100	ug/L

Comments

Iodine levels are interpreted using the WHO criteria. However, the creatinine-corrected iodine level allows for iodine assessment in urine samples which are more dilute or concentrated than usual.

WHO classification of iodine deficiency - Urine Iodine levels:

Not Iodine deficient:	> 100 ug/L	urine
Mild Iodine deficiency:	50 - 100 ug/L	urine
Moderate Iodine deficiency:	20 - 49 ug/L	urine
Severe Iodine deficiency:	<20	ug/L urine

To convert Iodine ug/L to Iodine nmol/L
 $\text{ug/L} \times 7.88 = \text{nmol/L}$

HMRC recommends supplementation of 150ug/day of Iodine to ensure that all women who are pregnant, breastfeeding or considering pregnancy have adequate iodine status. Women should not take kelp (seaweed) supplements or kelp based products because they may contain varying levels of iodine and may be contaminated with heavy metals such as mercury.

Lipid Profile

Test Name	Result	Reference Interval	Units
Cholesterol	5.0	<5.6	mmol/L
Triglyceride	1.0	<2.1	mmol/L
HDL	1.44	> 1.09	mmol/L
LDL	3.1	<4.1	mmol/L
Tot Chol/HDL	3.5	<4.6	
Non HDLC	3.56	<3.81	mmol/L

Comments

LDL is now calculated by the Sampson equation which allows an accurate result at higher triglyceride levels.

The National Vascular Disease Prevention Alliance (NVDPA) guidelines recommend a target level of less than 2.5 mmol/L for non-HDLC.

TARGET LEVELS:

The National Vascular Disease Prevention Alliance (NVDPA) treatment target levels for high risk people (known coronary heart and other arterial disease, diabetes, chronic renal failure, Aboriginal and Torres Strait Islander peoples and familial hyperlipidaemic conditions) are:

Total Cholesterol <4.0 mmol/L
HDL-Cholesterol \geq 1.00 mmol/L
Fasting Triglycerides <2.0 mmol/L
Non-HDL Cholesterol <2.5 mmol/L

Increased non-HDL Cholesterol is the most significant marker for subclinical atherosclerosis (ref: Cardiology Today 2013; 3(2) : pp25-27).

Homocysteine

Test Name	Result	Reference Interval	Units
Homocysteine	5.9	<15	umol/L

Comments

Serum homocysteine levels are markedly elevated (50 - 500 umol/L) in homocystinuria which is associated with childhood onset of ocular lens displacement, skeletal abnormalities and arterial and venous thromboses. Moderate elevations of serum homocysteine (16 - 100 umol/L) are seen in folic acid, vitamin B12 and pyridoxine deficiencies, several genetic defects, and renal failure. Elevated levels of serum homocysteine are associated with increased risk of atherosclerosis and venous thromboembolism.

Insulin

Test Name	Result	Reference Interval	Units
S-Insulin	4	3 - 15	mU/L

Comments

Please note: The insulin reference interval only refers to a fasting collection
Insulin concentration measured on Abbott Alinity. To convert to pmol/L, please multiply result by 6.
Please note: Different insulin assays may give variable concentrations.
Exogenous insulin use can also result in different concentrations depending on the type of insulin administered.

HbA1c

Test Name	Result	Reference Interval	Units
HbA1c (NGSP)	5.1	<6.5	%
HbA1c (IFCC)	32	<48	mmol/mol

Comments

The currently accepted cut-point for diagnosis of Type 2 Diabetes is an HbA1c level equal to or greater than 6.5% (48 mmol/mol) in patients with normal red blood cell turnover.
An abnormal screening HbA1c equal to or greater than 6.5% (48 mmol/mol) should be confirmed by a repeat HbA1c level as soon as possible, prior to any dietary adjustment or therapeutic intervention.
If the follow up HbA1c is less than 6.5% (48mmol/mol) then the patient does not have diabetes and should be rescreened in 12 months time.
(Ref: MJA 197/4:220-221 (2012))
Patients with HbA1c levels of 5.7 - 6.4% (38 - 46 mmol/mol) may still have a slightly increased risk of microvascular complications according to the AusDiab study.
The Medicare item for HbA1C for diagnosis of Diabetes Mellitus is limited to one test per 12 months; for monitoring Diabetes testing remains unchanged - 4 tests per 12 months.
Further information may be found at MBS online
<http://www9.health.gov.au/mbs/search.cfm>
An alternative test to monitor diabetes such as serum fructosamine is advisable in the presence of altered red cell lifespan.
HbA1c performed on the Sebia Cap3 analyser by capillary electrophoresis.

Thyroid Antibodies

Test Name	Result	Reference Interval	Units
Thyroid Peroxidase Ab	<1.0	<5.6	IU/mL
Thyroglobulin Ab	2.2	<4.1	IU/mL

Comments

Thyroid Antibodies: Levels up to 100 IU/mL can occur in normal subjects (5% of males, 15% of females – mainly elderly) and may also occur in non-thyroid autoimmune and chromosomal disorders.

Raised levels may occur in prodromal hypothyroidism before TSH elevations occur and may also be seen in thyrotoxicosis, thyroiditis, non-toxic goitre and thyroid cancer. The levels seen in Graves' Disease and Hashimoto's can vary from normal up to >1000, but are usually elevated.

Comments

Normal Iron Status.

Active B12 (holotranscobalamin) is the biologically active fraction of total serum B12, and should be a superior indicator of B12 status. **Holotranscobalamin** level indicates Vitamin B12 deficiency unlikely. Up to 15% of patients will have a deficiency of carrier protein (haptocorrin) that does not appear to result in a clinically recognisable Vitamin B12 deficiency despite low total Vitamin B12 levels.
