INCOMPLETE REQUEST

Test(s): ESR

Dear Doctor,

Please note that the test(s) listed above, for the stated date of service, were unable to be completed due to technical or specimen collection issues.

Unfortunately, we have not received the requested specimens for this patient. Consequently, to allow finalisation of this referral, these tests have now been cancelled. If you still require the test(s) to be performed, could you please re-order at the next consultation.

Requested Tests : DTH, RF, CRP, QNA*, QEN*, QDN*

Elevated rheumatoid factor is found in 50% of patients with early RA, 90% of patients with chronic RA and in a large number of systemic inflammatory disorders (e.g. Sjogren's syndrome, MCTD, cryoglobulinaemia, Subacute Bacterial Endocarditis). Suggest measurement of CCP antibodies (which are more specific for RA) if clinically indicated.

ANTINUCLEAR ANTIBODY SEROLOGY

Anti-nuclear antibodies Negative

The ANA test is negative at the screening dilution of 1:80. A negative ANA excludes SLE in most cases. Consider ENA screening for patients with features of Sjogren's syndrome (to detect antibodies to SS-A which may co-exist with a negative ANA). Anti-dsDNA antibody testing is usually not warranted with a negative ANA unless the clinical suspicion of SLE is high.

ENA and DNA results to follow.

Positive results from this assay are confirmed by line immunoblot.

If there is clinical suspicion of a synthetase syndrome, it is suggested that a myositis line immunoassay be requested.

Anti dsDNA Antibody: < 7 IU/mL (0-7)

Anti dsDNA antibodies are measured by radioimmunoassay (RIA). Double stranded DNA (dsDNA) antibodies are highly specific for Systemic Lupus Erythematosus (SLE). However, these antibodies are not present in all patients with SLE.

Anti dsDNA levels vary with disease activity and regular assessment is useful in patient monitoring.

86583325 Low ferritin confirms iron deficiency.

Note: Iron and transferrin results are not reportable due to haemolysis.

- As ferritin is influenced by acute phase responses results in the lower-normal range (30-100) may not exclude iron deficiency.
- Ferritin levels >100 and < upper limit usually reflect adequate iron stores.
- Serum iron is useless in determining tissue iron stores.
