Ultrasound Right Hip

ULTRASOUND RIGHT HIP

HISTORY:

Right trochanteric bursitis/ gluteus tendinitis +/- right SIJ and right L4-S1 FJA.

FINDINGS:

Anterior Hip:

Intact iliopsoas tendon and rectus femoris origin. No iliopsoas bursal distension.

No effusion or synovitis within the anterior recess.

Lateral Hip:

Partial tear of the gluteus minimus tendon measuring 6 x 14 mm with a background of tendinopathy.

Hypoechoic, heterogeneous and thickened gluteus medius tendon, suggesting tendinopathy with no appreciable tear.

Distension within the trochanteric bursa and reproduction of the patient's symptoms with provocation testing.

The iliotibial band and tensor fascia lata are intact.

Posterior Hip:

Intact hamstring origins.

The sciatic nerve is unremarkable without evidence of focal or diffuse thickening.

CONCLUSION:

Severe gluteus minimus tendinopathy and associated partial tear (14 x 6 mm) without complete rupture or retraction.

Gluteus medius tendinopathy with no associated tear.
Trochanteric bursal thickening and tenderness to probe pressure supports
bursitis.

Dr. Kael Baker

Thank you for referring Ms Robyn Ann Larance
