Dear Dr Riahifard

Re: **Mr Max Harrington - DOB: 22/11/2000**
164 Monbulk Rd SILVAN 3795

MRI Head

Clinical: Chronic unexplained headache. Left-sided nausea. History of arachnoid cyst and concussion.

Technique: Routine non-contrast multi sequence and multiplanar MRI including diffusion weighted imaging at 1.5 Tesla

Findings:

Comparison is made with MRI brain 26/02/2018.

Large arachnoid cyst in the right anterior temporal lobe extending superiorly into the frontal parietal region is unchanged in appearance and size (5.3 x 10.5 x 10.2 cm). No evidence of intrasiesional haemorrhage. Remodelling of the adjacent inner skull table similar to prior. There is marked local mass effect with 9 mm left midline shift is also stable.

No intracranial collection or haemorrhage. No microhaemorrhage. No abnormal restricted diffusion to suggest acute infarct. Ventricle calibre is unchanged compared to prior. Normal flow signal of the major intracranial vessels preserved. Paranasal sinuses and mastoid air cells are grossly clear. Orbits unremarkable.

Impression:

Stable appearance of large right arachnoid cyst with marked local mass effect. No new changes compared to previous MRI in 2018.
