Wellington 6021

Dear Oliver,

Our reference: 711666

DOB: 15/12/1986

NHI: LWN4916

Thank you for having a semen analysis at Fertility Associates. Below are the results of the analysis performed on 15/05/2025.

	Your Result		WHO Reference
Volume	3.8	mL	>1.5 mL
Sperm Concentration	29.8	million/mL	>15 m/mL
Total Motility	77	%	>40%
Progressive Motility (a+b)	62.1	%	>32%
Rapid (a)	11.8	%	
Slow (b)	50.3	%	
Non-Progressive (c)	14.9	%	
Total Progressive Motile Count (a+b)	70.322	million	
MAR (antibody screen)		%	<40% binding

It is important to understand that even in men without fertility concerns, sperm concentration and motility (the percentage of moving sperm) can vary significantly from week to week and month to month. These values may sometimes fall below the World Health Organization (WHO) reference range, even in healthy individuals.

Please also keep in mind that a semen analysis is just one part of a comprehensive fertility assessment. While it is entirely your choice how to interpret and act on these results, Fertility Associates strongly recommends discussing them with a fertility specialist or your GP. They can consider your full medical history and provide guidance on the most appropriate next steps.

Fertility Associates is not a registered pathology laboratory; our primary focus is fertility treatment. If you have further questions about your results, please speak with your fertility specialist or GP.

Kind regards,

Rowse, Clare  
Clinical Embryologist
