## **X-RAY CERVICAL SPINE**

### **History:**

Neck pain and stiffness. Decreased movement.

### **Findings:**

In the AP erect view there is slight tilting of the cervical spine to the right likely due to patient's posture. Moderate hypertrophic facet arthropathy noted. No cervical rib identified. Odontoid peg normal. C1/2 articulation normal except for degenerative changes.

In the lateral view there is no malalignment or abnormal prevertebral soft tissue swelling. No fracture. Disc space narrowed at C5/6 and C6/7. Moderate hypertrophic facet arthropathy present. No facet subluxation or dislocation seen in the oblique images. Exit foraminal narrowing noted at C5/6 on both sides and to a lesser extent C6/7. Appearances are consistent with cervical spondylosis.
