Accession: 80.1813039

MRI CERVICAL SPINE

CONCLUSION: Severe right C5/6 foraminal stenosis due to uncovertebral joint hypertrophy with potential for impingement of the exiting C6 nerve root.

Clinical Details: Months of paraesthesia and pain right upper limb in C6 dermatomal distribution.  
? Radiculopathy.

Report: Alignment is normal. The cervical cord appears normal.

At C2/3, C3/4 and C4/5 appearances are normal.

At C5/6 there is a broad based posterior disc bar and mild bilateral uncovertebral joint hypertrophy, more obvious on the right which is producing a severe right foraminal stenosis with potential for impingement of the exiting C6 nerve root.

At C6/7 there is a very shallow broad based posterior central disc bulge only. The central canal and foramina are clear.

At C7/T1 appearances are normal.

Thank you for referring Ms Beverley FRANKLIN.
