==== ORIGINAL REPORT ====

COMPARISON: CT from July 4, 2025 and bone scan from July 8, 2025

FINDINGS:

Somewhat mottled appearance of the left proximal femur involving the neck and intertrochanteric region concerning for metastasis. No acute displaced fracture is visualized. The left distal femur appears intact and normally aligned.

Moderate left hip osteoarthritis. Contrast is within the urinary bladder from recent contrast-enhanced CT.

Ill-defined sclerotic foci around the left acetabulum are better appreciated on concurrent CT.
