Comments on Collection 20-Feb-25 0720:

C Reactive Protein

CRP is a more sensitive early indicator of an acute phase response than is ESR. It also returns towards normal more rapidly with improvement or resolution of the disease process.

If CRP is elevated, it can indicate disease activity of an inflammatory, infective or neoplastic nature.

Artefactually decreased CRP values occur when patients are treated with antibiotics containing carboxypenicillins including Ticarcillin.

Lab Id.	640131634	663743019	681006991	Reference	Units	
Homocysteine	6.3	8.0	5.7	(<15)	umol/L	

Comments on Collection 20-Feb-25 0720:

Serum homocysteine levels are markedly elevated (50 - 500 umol/L) in homocystinuria which is associated with childhood onset of ocular lens displacement, skeletal abnormalities and arterial and venous thromboses. Moderate elevations of serum homocysteine (16 - 100 umol/L) are seen in folic acid, vitamin B12 and pyridoxine deficiencies, several genetic defects, and renal failure. Elevated levels of serum homocysteine are associated with increased risk of atherosclerosis and venous thromboembolism.

Streptococcal Serology

Anti-Streptolysin O (ASO) 68 (<250) IU/mL
Anti-DNase B <90 (<250) U/mL
Comments on Lab Id: 681006991

An elevation of one or both antibodies occurs after infection. Peak levels are achieved 3-6 weeks after onset, following uncomplicated infection. ADNase B levels are more likely to rise after streptococcal skin infections. Elevated antibody levels may take considerable time to return to normal (ASO up to one year, ADNase B up to two years). The sensitivity of the ASO in rheumatic fever and post-streptococcal glomerulonephritis is about 85% and greater when ADNase B is included. Levels may have fallen in patients with delayed sequelae (eg. chorea).

Lipoprotein (a) 78.4 H(<75) nmol/L

Comments on Lab Id: 681006991

Please note: As of 19 August 2024 Lipoprotein (a) will be measured using a molar assay based on the Denka Seiken antibodies.

There is currently no generalized consensus on Lipoprotein (a) cardiovascular risk thresholds and the individual person's background cardiovascular risk needs to be considered when interpreting lipoprotein (a) concentrations.

The Australian Atherosclerosis Society suggests a concentration > 100 nmol/L as the threshold above which risk increases (Heart Lung Circ. 2023 Mar;32(3):287-296).

Higher concentrations may be seen in impaired renal function, pregnancy, hypothyroidism, growth hormone replacement, and inflammatory conditions. Severe acute phase conditions, hyperthyroidism and menopausal hormone therapy may decrease concentrations.

Copper-plasma				8.8 L (11.0-22.0) umol/L

Comments on Collection 20-Feb-25 0720:
Copper (Serum)
Decreased serum copper may reflect either low caeruloplasmin levels or copper deficiency. Low serum copper occurs in malabsorption, chronic diarrhoea, hypoproteinaemia, inadequate total parenteral nutrition, biliary fistulae and in Wilson's disease.

Free Copper
[

Copper-serum	9.0 L	(11.0 - 22.0)	umol/L
Caeruloplasmin	0.15 L	(0.20 - 0.45)	g/L
Caeruloplasmin	1.1 L	(1.5 - 3.4)	umol/L
Copper/Caeruloplasmin	8.2	(7 - 10)	mol/mol

Comments on Lab Id: 681006992

This patient may have copper deficiency. A normal copper to caeruloplasmin ratio makes Wilsons disease unlikely. If clinical suspicion remains high, suggest measuring 24-hour urine copper.
