

Patient Name	MCGRATH, ANTHONY	Accession	12326439Z1
Patient D.O.B.	06/04/1963	Description	MRI RIGHT HIP
Patient ID	SKG2043773	Study Date/Time	10/06/2025 10:33
Referring Physician	MILNE, LACHLAN	Modality	MR,PR

MRI RIGHT HIP

Clinical History: Pain? Cartilage? OA? Labrum? Gluteal.

Findings: Correlation with x-ray of June 2025.

There is mild convexity/cam morphology of the anterosuperior femoral head-neck junction. Reduced coverage lateral centre edge angle 20 degrees.
There is irregular tear of the anterosuperior > lateral labrum.

There is mild chondral wear of the lateral margin of the acetabulum + femoral head. No joint effusion or synovitis.

Unremarkable appearance of the iliopsoas tendon and rectus femoris.

Mildly attenuated 38 mm length of the insertional gluteus minimus tendon on a background of mild tendinosis + poorly defined low-grade tear of the deep fibres of the tendon.

There is poorly defined high grade split tear involving 25 mm length of the insertional anterior gluteus medius tendon. There is peritendinous oedema.
Mildly attenuated posterior tendon. Small enthesophytes of the greater trochanter/attachments of the gluteal tendons.

There is trace of fluid + mild oedema of the subgluteal and greater trochanteric bursa.

Poorly defined moderate grade interstitial tear of the conjoint tendon about the ischial attachment.
The sciatic nerve is intact.

Comment:

Irregular labral tear + mild chondral wear of the lateral hip joint margin.

High grade tear of the insertional anterior gluteus medius tendon, and moderate grade tear of the gluteus minimus tendon
Mild-to-moderate subgluteal and greater trochanteric bursitis.

Moderate grade interstitial tear of the ischial attachment of the conjoint component of the hamstring tendon.
