Thank you for seeing Christopher Butcher, age 56 yrs, for an opinion and management. Chris is on follow up following Work related injury and underwent previous surgeries, Nerve ablations and steroid injection. He is complaining of ongoing pain and recent onset of sudden loss of sensation and power of bilateral lower limbs and recurrent falls. Investigated with repeat MRI scan and report is attached. Kindly see him ASAP and advise on his care.  
Thank you.

## **Past History:**

25/10/2016	Laminectomy	L4/L5 + L5/S1 Laminectomy, Rhizolysis, L4/L5/S1 Stereotactic Pedicle screw internal fixation, Posterolateral fusion and Harvest Bone graft
09/02/2021	Radiofrequency ablation	Radiofrequency ablation - Bilateral L3/L4 facet joints denervation and R/L4 Radicular

Steroid injection

22/03/2021 Right Leg cramps  
15/02/2022 Neurogenic pain  
12/09/2025 GORD

**Allergies:**

Nil known.

**Current Medications:**

Advantan 0.1% Fatty Ointment  
Celebrex 200mg Capsule  
Nexium 20mg Tablets  
Targin 5mg; 2.5mg Modified release tablets  
Twynsta 80mg; 5mg Tablet  
Viagra 100mg Tablet

Topical application - BD.  
200mg Daily with meals As directed.  
20mg Daily As directed m.d.u.  
1 Tablet Three times a day As directed.  
1 Tablet Daily As directed m.d.u.  
½-1 tab Stat p.r.n.

Dr J. Velautham

MRI L SPINE (SEDATION) WC 30/10/2025 Reference: 17948718

**MRI LUMBAR SPINE**

**CLINICAL HISTORY:** Worsening sudden loss of sensation bilateral lower limbs and power with recurrent

falls

**TECHNIQUE:** Non-contrast scan.

**FINDINGS:** Comparison is made with the previous study of 29/7/2022.

**L1-2:** Normal.

**L2-3:** No significant disc protrusion or neural compression.

**L3-4:** Severe central canal stenosis secondary to a combination of annular disc bulge and posterior element hypertrophy. This appears worse than before, with increased effacement of the posterior epidural fat pad, and increased redundancy of the cranial cauda equina nerve roots. Mild bilateral noncompressive foraminal stenosis, similar to the previous scan.

**L4-5 and L5-S1:** There has been previous posterior lumbar interbody fusion and overlying laminectomies. Intervertebral cage insertion at L4-5. No high-grade stenosis to suggest definite neural compression.

**CONCLUSION:** L3-4 severe central canal stenosis, which appears increased compared to the previous scan.

Radiologist: Dr Y. Kwong
