Dear ,

Re : MRS NIREE WEYBURY - DOB: 07/10/1977
265 McHargs Road WILLOWMAVIN VIC 3764

EXAM:

CT SPINE LUMBAR WITHOUT CONTRAST

CLINICAL HISTORY:

Worsening back pain with right leg radiculopathy. L5/S1 prolapse.? Worsening

TECHNIQUE:

Noncontrast CT lumbar spine.

COMPARISON:

No previous imaging available for comparison.

FINDINGS:

Spinal posterior alignment is normal. There is no compression fracture, height loss or focal bone lesion.

L1-L2: Unremarkable.

L2-L3: Mild endplate degeneration. No central canal or foraminal stenoses.

L3-L4: Shallow disc bulge. No central canal or neural foraminal stenoses.

L4-L5: Mild facet joint degeneration. Shallow broad-based disc bulge. Potential impingement of descending right L5 nerve root in the subarticular recess. Exiting nerve roots are intact.

Report continued...

Re: MRS NIREE WEYBURY DOB: 07/10/1977

L5-S1: Marked endplate degeneration. Vacuum phenomenon disc. Posterior osteophytes and impingement of the thecal sac. Facet joint degeneration. Moderate left neural foraminal stenoses affecting left L5 nerve roots. Descending S1 nerve roots are in contact with osteophytes in the subarticular recess.

IMPRESSION:

Marked degenerative changes at L5-S1. Potential impingement of exiting left L5 nerve roots in the neural foramen and bilateral descending S1 nerve roots.

Disc bulge and degeneration at L4-L5 and potential impingement of descending right L5 nerve root in the subarticular recess.
