CT L SPINE 16/12/2020 Reference: 1825325

## CT LUMBAR SPINE

Clinical History: Low back pain with radiation to left hip and left lower limb.

Technique: Noncontrast CT was performed through the lumbar spine.

### Findings:

The lumbar spine demonstrates normal alignment. The lowest disc space is defined as L5/S1. There is disc and facet joint degenerative change at multiple levels.

L1/2 demonstrates no central canal or foraminal narrowing.

L2/3 demonstrates generalised disc bulge with no central canal narrowing identified. There is mild bilateral foraminal narrowing due to facet joint arthrosis and osteophytes.

L3/4 demonstrates no central canal narrowing. Exit foramina are clear.

L4/5 demonstrates generalised disc bulge and ligamentum flavum thickening causing mild central canal narrowing. There is mild bilateral foraminal narrowing.

L5/S1 demonstrates no focal central disc protrusion. There is no central canal or foraminal narrowing.

**Conclusion:**

There is mild L4/5 central canal narrowing. On the left side, the worst level of foraminal narrowing is L4/5 and L2/3. Please correlate with any appropriate radiculopathy.
