Referrer:
Dr Jeyadinesh Velautham
Exam:
XR Ankle - Right
Accession:
5000654515
Exam Date:
29/05/2018 12:06 PM

X-RAY RIGHT ANKLE

Clinical Notes:
Recurrent ankle injury with swelling.

Findings:
There is mild soft tissue swelling about the ankle. A 3mm well corticated ossicle adjacent to the medial malleolus seems to be from remote trauma. The ankle mortise is maintained. There is a lucency along the lateral aspect of the dome of the talus,

suspicious for an osteochondral injury but no distinct loose body is noted. Mild spurring at the distal end of the tibia. No plantar calcaneal spur.

Dictated By: Bimal Parameswaran - 29/05/2018

Approved By: Bimal Parameswaran- 29/05/2018

XRAY RIGHT TIBIA, FIBULA AND ANKLE

There are mild degenerative changes at the ankle joint. Minor bony fragmentation at the medial malleolus may relate to previous chronic trauma. No focal bone lesion or acute fracture. Small posterior joint effusion.
