HDL-Cholesterol

The National Vascular Disease Prevention Alliance (NVDPA) guidelines recommend a target level of less than 2.5 mmol/L for non-HDLC.

TARGET LEVELS:

The National Vascular Disease Prevention Alliance (NVDPA) treatment target levels for high risk people (known coronary heart and other arterial disease, diabetes, chronic renal failure, Aboriginal and Torres Strait Islander peoples and familial hyperlipidaemic conditions) are:

|                       |        |        |
|-----------------------|--------|--------|
| Total Cholesterol     | <4.0   | mmol/L |
| HDL-Cholesterol       | >=1.00 | mmol/L |
| Fasting Triglycerides | <2.0   | mmol/L |
| Non-HDL Cholesterol   | <2.5   | mmol/L |

Increased non-HDL Cholesterol is the most significant marker for subclinical atherosclerosis (ref: Cardiology Today 2013; 3(2) : pp25-27).

Iron Studies

Ferritin elevation where transferrin saturation is <=45% may be due to liver or renal disease or other inflammatory conditions due to infections, malignancy or autoimmune diseases. Suggest repeat iron studies with serum CRP at 3-6 month intervals if nature of abnormality remains unexplained.

All patients with low or equivocal vitamin B12 results (380 pmol/L or less) will be routinely tested for holo-transcobalamin (active B12) to clarify the B12 status.

Both tests are now Medicare rebateable. Vitamin B12 concentrations over 380 pmol/L are generally considered replete.

C Reactive Protein

Interpretation: Elevation in CRP indicates disease activity of an

inflammatory, infective or neoplastic nature. CRP is a more sensitive early indicator of an acute phase response than is the ESR. It also returns towards normal more rapidly with improvement or resolution of the disease process.

Artefactually decreased CRP values occur when patients are treated with antibiotics containing carboxypenicillins including Ticarcillin.

Comments on Collection 07/02/22 0825 F:

Please Note: HE4 is now available as a tumour marker for ovarian cancer. HE4, when combined with CA125 in the Risk of Ovarian Malignancy Algorithm (ROMA) gives higher sensitivity and specificity than CA125 alone. It is currently a non-rebatable test. It can be requested by writing HE4.

CA125 is elevated in about 80% of patients with epithelial (serous, endometrioid, clear cell and undifferentiated) ovarian cancer. Rising levels are highly suggestive of recurrent disease, but in 30% of those with recurrent disease, no rise in level is seen. Elevated levels are also documented in pregnancy, at menstruation, in endometriosis, liver disease, ascites and with some other malignant tumours (including endometrium, fallopian tube, pancreas, lung).

CA 125 performed using Abbott CMIA.
