Thyroid Check

Summary

Congratulations on taking the Thyroid Check which puts you in control of your health data!

i-screen

Collection Date: 16 May 2022

Thyroid Function

The pattern of mildly elevated TSH levels but normal FT3 and FT4 is referred to as subclinical hypothyroidism - the source of the mild elevation of TSH is typically mild thyroid failure, with one implication being the potential for progression to clinical hypothyroidism. Antithyroid antibodies may be detected in up to 80% of individuals with subclinical hypothyroidism.

TSH 5.3 mIU/L

Communicates with the thyroid gland to produce T3 and T4 which regulate metabolic functions. High TSH thyroid test levels indicates an underactive thyroid, and low levels an overactive thyroid.

FT4 14 pmol/l

Measures the thyroxine that is freely circulating and able to regulate metabolism. High FT4 thyroid test levels indicate an overactive thyroid, and low levels an underactive thyroid.

FT3 5.2 pmol/l

Measures the triiodothyronine that is freely circulating. High FT3 thyroid test levels indicate an overactive thyroid, and low levels an underactive thyroid.

Recommendations

Consider a thyroid antibodies test

Given the results of your thyroid function test, you may want to consider testing your thyroid antibodies. If you request this within the next 48 hrs whilst the lab still has your sample, we can add this test on to avoid you having to visit the collection centre again. The thyroid antibodies can be ordered here: [Thyroid Antibodies Add-on](#).

Check in with your GP

As always, please visit your GP to discuss your results. Laboratory investigations are an important aspect of healthcare, however they must be viewed in the wider context of your medical history, current health and concerns, physical examination findings and other investigations. These results do not replace the need for face to face medical consultation or regular visits to your local GP. Please contact us if you would like a copy of your lab report.
